

ACSA challenges causes of Global Warming, confronts Al Gore on consequences of his spreading misinformation.

Released on: February 9, 2008, 9:56 pm

Press Release Author: Rosemary Curie / [ACSA](#)

Industry: [Environment](#)

Press Release Summary: Famed research foundation proposes the real threat is, due to the net loss of nearly 10 billion acres of trees since 1492 AD, that humans have damaged the Oxygen/Carbon cycle, which within 250 years could lead to human extinction. (<http://10ba.org>)

Press Release Body: **ACSA** believes it has found the real cause of **Global Warming**: a little known era called "**the Interglacial Period**" that has been underway for nearly 18,000 years since the first half of a post **Pleistocene Era Ice Age**. **Ice Ages** are split into two halves, each equally frozen periods. In between, the **Interglacial Period** is a period of alternating **Global Warming** and **Global Cooling** cycles caused by changes in the Earth's ocean levels, carbon cycles, ocean saline levels and the Earth's angle of axis.

Earth has reached a **Warming cycle** that will end in the next 250 to 2000 years, but, it is still far, far colder than it was during the **Pleistocene Era** and precursors, which was the many millennium period on earth when Life emerged and expanded, after leaving the “**snowball**” like state it was in 340 million years ago.

It is actually NORMAL for the earth to be heating at this moment, with human activities contributing only a modest amount to that warming cycle, about 6/740th over all or 8 tenths of 1 percent in terms of the amount of CO2 contributed (6 billion versus 740 billion tons).

ACSA confronted **Al Gore** with the facts, publicly, but has not received a formal reply to the analytic information presented on its new website for the purpose of halting the **Oxygen Depletion: “Ten Billion Acres”** (<http://10ba.org>).

*“Al Gore is, quite simply, wrong in blaming human activities as the cause for **Global Warming**. However, it is quite easy to get confused with a rise in CO2 in the atmosphere and what is really behind **Global Warming**. The earth is going through a natural glacial decline and arctic/antarctic ice cap meltdown. We needn't worry about it recooling, as the space around us is enormously cold.”* says **Ed Englebart, PhD, a representative of the ACSA and chair of the 10BA project**. *“We have, however, found worse news in analyzing the misinformation and bad science found in '**An Inconvenient Truth**', for which and other activities, Mr. Gore received one very inappropriate Nobel Prize I might add. Fact is, apparently unbeknownst to Gore, humanity is facing extinction from a different cause.”*

“In 1492 our planet had Eighteen and a Half (18.5) billion acres of forests (and associated forest plant life, soils, insects and so on). Unfortunately, due to the expansion of civilization, we are today only left with Eight and a Half (8.5) billion acres: there has been a net loss of 10 Billion Acres of trees. During that time, 500 years about, other photosynthetic life has compensated for human existence and CO2 by the expansion of Algae, which now deliver nearly 66% of all Oxygen to our Atmosphere through photosynthesis of sunlight and CO2. In 1492, Algae only delivered 33%, the trees did the rest. However, we are rapidly outgrowing the Algae's ability to compensate the atmosphere.” commented the spokesperson.

“Within 50 years we will see significant decline in Oxygen to the point where, within 250 to 500 years, there won't be enough to go around. We've worsened the picture by mining coal, it has left the earth

without it's 'liver', filtering that ordinarily removes toxins from runoff water. And our tendency to pollute the air does not help. Ground pollutants and agricultural runoff has damaged the rivers and oceans with pollutants normally not present, altering Algae's ability to photosynthesize and creating microbes in the earth's waters never before seen. This is accelerating forward the date after which we can no longer survive. We need to plant back those missing ten billion acres of trees, and put rock artesian filtration into the spaces formerly occupied by Coal. Or humanity will become extinct!" Englebart continued.

The **ACSA** has organized a plan to build huge tree arbors in properly situated locations around the Earth and is seeking help doing so.

For more information, contact the **ACSA** via web at <http://10ba.org> (the 10 Billion Acres website). **ACSA** is a 501(c)3 tax exempt private foundation with a public focus on advocacy and programs that contribute to the quality of life on earth. It is headquartered in Los Alamos, New Mexico with business offices in central New Jersey. Its main web is <http://acsa.net>.
